Annotation: This article focuses on the pedagogical and psychological aspects of training teacher educators for preschool educational organizations. The main purpose of the topic is to study the training of teachers in the preschool education system and the importance of pedagogical and psychological foundations in this process. Pedagogical and psychological training of teachers ensures their success in working with children. The level of training of teachers increases with the help of innovative pedagogical technologies.

Keywords: Preschool education, pedagogical and psychological characteristics, training, methods, tools.

INTRODUCTION

In the preschool education system, pedagogical and psychological characteristics of training educators, modern trainings, methods and tools play an important role in improving the qualifications of educators and helping them in their professional growth. Educators in preschool educational organizations, that is, educators, have a direct impact on the development of children, therefore, their pedagogical and psychological training should be high. The main goal of studying this topic is to determine how psychological approaches, modern trainings and pedagogical tools can be effectively used in the training of educators.

The psychological preparation of educators ensures their success in working with children. At a time when preschool children begin to form their worldview and social skills, the role of the educator is very large.

The emotional intelligence of educators, that is, the ability to manage their emotions and establish proper communication with others, is the main psychological aspect of their professional activities. Educators need to develop the skills of flexibility, kindness to children, and understanding of the child's psyche. This helps children behave correctly and develop their social skills.

The importance of training in the training of educators is as follows:

Purpose of training: Training for educators serves not only to update their knowledge, but also to increase their psychological and emotional readiness. Training plays an important role in building relationships, managing stress, and developing social skills.

Practical training: Training should be practical and interactive. Educators should be given the opportunity to deal with specific situations that arise when working with children, such as resolving conflicts between children, overcoming socio-emotional problems.

Simulations and role-playing games: During the training, teachers are taught various situations that

arise with children through role-playing games and simulations. This teaches the teacher how to behave and what decisions to make when communicating with children.

The importance of using pedagogical methods and tools:

Innovative pedagogical methods: The effectiveness of pedagogical methods is important in stimulating children's activity in the educational process and ensuring their personal development. Interactive methods (discussion, group work, brainstorming) and individual approaches should be used in preschool education.

Didactic tools: Modern didactic tools and educational materials for educators help make children's education interactive and interesting. These include multimedia educational tools, computer technologies, textbooks and games.

Technological tools: Modern technologies, such as interactive whiteboards, online platforms, mobile applications and games, create opportunities for educators to organize the educational process interactively, interestingly and effectively. For educators, such tools provide opportunities for self-assessment, real-time analysis of the learning process.

The main task of pedagogical psychology is to help educators gain a deep understanding of child psychology. This approach increases the success of educators in working with children, allows them to create pedagogical approaches that are appropriate for the development of children.

Differentiation approach: Since each child has unique characteristics, educators must organize the educational process in accordance with the individual needs of children. To do this, educators must have solid psychological training, as well as use different approaches and methods.

Emotional development of children: Educators must support the emotional development of children and help them adapt to the social environment. With the help of psychological approaches, educators will be able to successfully communicate with children and respond to their psychological needs.

The need for training and methods: Training, methods and tools are necessary to improve the pedagogical and psychological training of educators in the preschool education system. This will help to effectively organize the professional activities of educators.

The importance of innovative approaches: Modern pedagogical methods and technologies, as well as psychological approaches, increase the success of educators in communicating with children, therefore their training is of great importance in improving the quality of education.

Future development: Developing the psychological training of educators and supporting them with modern methods will lead to improving the quality of the education system.
